

# Edge Detection

# Processing example

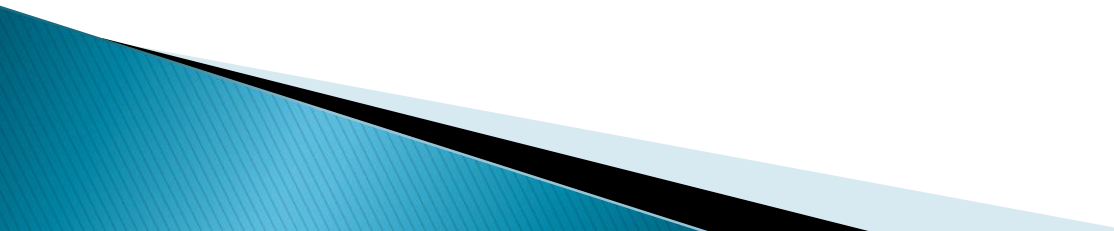

(a) Original image

(b) Traditional Canny algorithm

(c) Improved Canny algorithm

## Edge Detection

This step has 4 separate phases:

1. **Smoothing:** Blurring of the image to remove noise.
  2. **Finding gradient:** The edges should be marked where the gradients of the image has large magnitudes.
  3. **Non-maximum suppression:** Only local maxima should be marked as edges.
  4. **Thresholding:** Potential edges are determined by thresholding.
- 

# Step 1 : Edge Detection

Input RGB Image

Convert to Grayscale

Apply Smoothing(Gaussian 5x5)

Find Edge gradient and Magnitude

Non-maximum Suppression

Output image(containing all possible edges)

## 1.Smoothing

- Smoothing is done by using averaging masks.
- Every pixel is set a new calculated value.
- I used gaussian 5x5 mask for smoothing.

$1/16^*$

1	2	1
2	4	2
1	2	1

$\frac{1}{115}$

2	4	5	4	2
4	9	12	9	4
5	12	15	12	5
4	9	12	9	4
2	4	5	4	2

**Figure 3** Discrete approximation to Gaussian function with  $\sigma=1.4$

Original Image

Using 3x3 kernel

Using 5x5 kernel

Blurred images

## 2. Finding Gradient magnitude and direction

➤ I used sobel masks for finding gradient magnitude and direction.

-1	0	+1
-2	0	+2
-1	0	+1

Gx

+1	+2	+1
0	0	0
-1	-2	-1

Gy

Gradient magnitude =  $\sqrt{(Gx)^2 + (Gy)^2}$   
Direction =  $\text{atan}(Gy/Gx)$

Sobel operator

-1	0	1
-2	0	2
-1	0	1

Grayscale  
Image pixel

0	255	255
0	255	255
0	255	255

Sobel operator

1	2	1
0	0	0
-1	-2	-1

Calculate Gx

$$\begin{aligned}
 &(1 \times 255 + 2 \times 255 + 1 \times 255) - \\
 &(1 \times 0 + 2 \times 0 + 1 \times 0) \\
 &= 1020 - 0 \\
 &= 1020
 \end{aligned}$$

Calculate Gy

$$\begin{aligned}
 &(1 \times 0 + 2 \times 255 + 1 \times 255) - \\
 &(1 \times 0 + 2 \times 255 + 1 \times 255) \\
 &= 765 - 765 \\
 &= 0
 \end{aligned}$$

Applying Sobel operator

# Calculation of Gradient Magnitude and Direction

Gradient magnitude

$$G = \sqrt{G_x^2 + G_y^2}$$

$$= \text{sqrt}(1020^2 + 0^2)$$

$$= 1020$$

Gradient direction,

$$\text{Theta} = \tan^{-1}(G_y/G_x)$$

$$= \tan^{-1}(0/1020)$$

$$= 0^\circ$$

## Selecting Gradient direction:

We are interested in horizontal, vertical or diagonal edges. So From a pixel (x,y), there are four possible directions– 0,45,90 and 135 degree. So direction is assigned to each pixel (x,y) From our calculated direction as following table

Calculated Direction	Assigned Direction
0°–22.5° (Yellow)	0°
22.5°–67.5° (Green)	45°
67.5°–112.5° (Blue)	90°
112.5°–157.5° (Red)	135°
157.5°–180° (Yellow)	0°

### 3. Non Maximum Supression

- Not all point should be kept as edge pixel, only those which are at a local maxima.
- All non maximum points should be removed.

Using 3x3 kernel

Using 5x5 kernel

After non maximum suppression

## 4.Thresholding

- There may exist some false edges still because of noise or color variation.
- To remove these, the edges weaker than a certain value (threshold value) is removed.

Using 3x3 kernel

Using 5x5 kernel

Applying Threshold value

**Thank you**
